NOTE: This record contains 1 individual

* Sequencing reads that have not been assembled into
* configs. Mans of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that

* NOTE: This record contains 1 individual

* Sequencing reads that have not been assembled into

* contigs. Runs of N are used to separate the reads

* and the order in which they appear is completely

* arbitrary. Low-pass sequence sampling is useful for

* dentifying clones that may be gene-rich and allows

* overlap relationships among clones to be deduced.

* vorces.

                         The specification describes a pair of transgenic winter oilseed rape plants suited for producing hybrid seed. One of the plants has an expression cassette comprising a male-sterility gene (e.g. barnase gene), and the other plant has an expression cassette comprising a fertility restorer gene (e.g. barstar gene), integrated into the genome. The fertility restorer gene is capable of preventing the activity of the male-sterility gene. The plant pair is useful for producing hybrid seed. Plants developed from the hybrid seed have agronomic performance, genetic stability and adaptability to different genetic backgrounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PCR primer B03, to recognise foreign DNA and flanking sequence of MS-B2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 seed, cells or tissues, characterised by harbouring a specific transformation event, particularly by the presence of a male-sterility gene, at a specific location in the Brassica genome. Transgenic brassica plant is useful for producing a hybrid seed by crossing the transgenic plant with a male-fertile Brassica plant and harvesting the hybrid seed from the transgenic Brassica plant.

The present sequence is PCR primer which is used to recognise foreign DNA and a flanking sequence of elite event MS-B2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Transgenic Brassica plants, seeds, cells or tissues, characterized by harboring specific transformation events, particularly by presence of male-sterility gene, at specific location in its genome -

It can be used in the prodn. of transgenic plants expressing cruciferin in its seeds for use in an industrial process. The seeds conig. the cruciferin can be used without the need for first extracting and/or isolating the enzymes. The use of seeds for the storage of cruciferin provides a stable vehicle which is easily packaged and transported and easily handled during use.

                                                                                                                                                                                                                                                                                                                                                         982 nucleotide sequences isolated from the Enterococcus facealis genome.
AAX12938 to AAX13919 represent these nucleotide sequences which are
primary nucleotide sequences, also known as contigs. The computer-based
system can identify fragments of the Enterococcus facealis genome with
commercial importance. The products can be used to detect the presence
of Enterococcus facealis in samples. They can also be used for
progression of disease, and for identifying agents which can be used
modulate the growth or pathogenicity of Enterococcus facealis, or
another related organism, in vivo or in vitro. In particular the
polypeptides encoded by the Enterococcus facealis nucleotide sequences
can be used in vaccines to prevent or attenuate an Enterococcal
                                                                                                                                                                                                                                                                                                                                                   computer readable medium has been developed which has recorded on it
                                                                                                                                                                                                                                                                    New isolated Enterococcus faecalis polynucleotides and polypeptides - used to develop products for the detection of Enterococcus and for use in vaccines for prevention or attenuation of Enterococcus

ö

Found in all bacteria and is also round in chloroplasts and diatoms. It rescuing truncated minas which have lost stop codons. Sizh genes and rescuing truncated minas which have lost stop codons. Sizh genes and times a grant be used as target regions in nucleic acid probe assays for the detection, identification or quantification of a prokaryotic or eukaryotic organism. CDNA transcripts of tunkna molecules (corresponding to a region of high homology from the 5' end or the 3' end of the DNA molecule can be used as a universal target region in a nucleic acid probe assay, while a fraquent of the sizh gene or a mucleic acid probe assay, while a fraquent of the sizh gene or a nucleic acid probe assay, while a fraquent of the sizh gene or a nucleic acid probe assay, while a fraquent of the sizh gene or a nucleic acid probe assay, while a fraquent of the sizh gene or a nucleic acid probe assay, while a fraquent of the sizh gene or a sa a target region for the generation of genus specific probes. These regions in a safet region for the generation of genus specific probes. These regions corresponding to a region of low homology can be used as the basis for amplification primer design. The target regions may be used as the basis of an assay for distinguishing a prokaryotic or eukaryotic or euka The invention relates to the ssrA gene or tmRNA, an RNA transcript of the ssrA gene, or fragments thereof as target regions in a nucleic acid probe assay for the detection and identification of prokaryotic and/or eukaryotic organisms. The invention also relates to 38 novel ssrA sequences and their tmRNA transcripts (claimed), and to pan-bacterial, genus- and species-specific asrA gene/funRNA directed probes and PCR primers (claimed). tmRNA is a stable, high copy number RNA which is found in all bacteria and is also found in chloroplasts and diactoms. It for therapoutic purposes, and target regions may be used to monitor the efficacy of drug therapies against infectious agents. Target regions may also be used to monitor the viability and level of probiotic organisms in the gastrointestinal tract. The methods and nucleic acids and compositions of the invention have applications in medicine, and also in industry (e.g., for assessing bacterial contamination of a foodstuff or an environmental sample). Sequences AAFI5338-F15442 represent sera genes, or fragments thereof, from a wide variety of organisms. Use of sarA gene, tmRNA, or fragments of them, as target regions in probe assays for detection of prokaryotic or eukaryotic organisms, and for determination of species -Disclosure; Page 55; 221pp; English. Use of ssrA gene, tmRNA, or fragments of them, as target regions in probe assays for detection of prokaryotic or eukaryotic organisms, and for determination of species -

Disclosure; Page 55; 221pp; English.

The invention relates to the ssrA gene or tmRNA, an RNA transcript of the ssrA gene, or fragments thereof as target regions in a nucleic acid probe assay for the detection and identification of prokaryotic and/or eukaryotic organisms. The invention also relates to 38 novel ssrA sequences and their timeMa transcripts (claimed), and to pan-bacterial, csquences and their timeMa transcripts (claimed), and to pan-bacterial, genus - and species specific ssrA gene/tmRNA discreted probes and pcR primers (claimed). tmRNA is a stable, high copy number RNA which is confident in all bacteria and is also found in chloroplasts and distons. It has a dual function both as a tRNA and as an mRNA and is involved in rescuing truncated mRNAs which have lost stop codons. SsrA genes and transcripts of the sasays for the detection, identification, or quantification of assays for the detection, identification, or quantification of assays for the detection, identification, or quantification of assays for the detection or lower process. The sast and as a universal transcript or a region of high homology from the 5' end or the 3' end of the DNA molecule can be used as universal target region in corresponding to a region of 10w homology from the 5' end or the 3' end of the DNA molecule corresponding to a region of 10w homology and passay of the DNA molecule corresponding to a region of 10w homology and because or a target region to distinguish between species and as a target region of genus-specific probes. These regions may be used as the basis for amplification primer design. The crash of probe formmat for broad scale detection and/or identification of amultiple probe formmat for broad scale detection and identification of the broad scale high throughput detection and identification of the broad scale high throughput detection and identification of the broad scale high throughput detection and identification of an stable public organism and distinguish between strains of the sars gene or the tmRNA transcript can be used in a massay to ob efficacy of drug therapies against infectious agents. Target regions may also be used to monitor the viability and level of probiotic organisms in the gastrointestinal tract. The methods and nucleic acids and compositions of the invention have applications in medicine, and also in industry (e.g., for assessing bacterial contamination of a foodsfulf or an environmental sample). Sequences AAF15443-F15547 represent thrans, or fragments thereof, from a wide variety of organisms.

```
The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 1'-end sequence complementary to a polynucleotide which comprises a 1'-end sequence of the combination of the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the full-length cDNAs. The primers are also useful for the full-length cDNAs. The primers are also useful for the full-length cDNAs. The primers are also useful for the full-length cDNAs. The primers are also useful for the full-length cDNAs and primers allow obtaining of the full-length cDNAs and primers allow obtaining of the full-length cDNAs and primers allow obtaining of the full-length cDNAs and PAH13613 to AAH13613 to AAH13613 to AAH13613 to represent human amino acid sequences; and AHH13612 to AAH13613 to represent contents allow which are used in the exemplification

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonuclectide complementary to comprise the complementary strand of a polynuclectide which comprises one of complementary strand of a polynuclectides; or (b) a combination of an oligonuclectide comprises a sequence complementary to the comprise and a polynuclectide which comprises a 5'-end sequence and an oligonuclectide comprising a sequence complementary to the polynuclectide which comprises a 3'-end sequence complementary to a polynuclectide which comprises a 3'-end sequence of sequence of an oligonuclectide comprises a 3'-end sequence of the sequence of the comprises at least 15 nuclectides and the combination of the 5'-end sequence 15'-end sequence 16'-end sequence 1
                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; primer; detection; diagnosis; antisense therapy; gene therapy; ss.
all of which are used in the exemplification

The present invention describes primer sets for synthesising 5602
full-length cDNAs defined in the specification. Where a primer set
comprises: (a) an oligo-dT primer and an oligonuclectide complementary
complementary strand of a polynuclectide which comprises one of
the 5602 nucleotide sequences defined in the specification, where the
complementary strand of a polynucleotide which comprises as the complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to a
polynucleotide which comprises a 3'-end sequence. Where the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to a
polynucleotide comprises a 1-east 15 nucleotides and the combination of
the specification. The primer sets can be used in antisense therapy and
the specification. The primers are useful for synthesising polynucleotides,
particularly full-length cDNAs. The primers are also useful for the
detection and/or diagnosis of the abnormality of the proteins encoded by
                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; primer; detection; diagnosis; antisense therapy; gene therapy; ss.
AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to AAB95493 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the

                                                                                                                       ö
the full-length cDNAs. The primers allow obtaining of the full-length CDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to AAH054893 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonuclectides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                         Human secreted protein-encoding gene 8 cDNA clone HSYA250, SEQ ID NO:49.

AAEO1293-AABO1200 represent CDNARS COTRESPONDING TO 3 number secreted protein servered AAEO1218-AAEO1226 represent human secreted proteins they encode. AAEO1218-AAEO1226 represent human secreted proteins they encode. The secreted proteins and their genes are useful for preventing. The secreted protein in a sample or by protein or gene therapy. Pathological conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new protein in a sample or by determining the presence of mutations in the new protein in a sample or by determining the presence of mutations in the new protein in a sample or by determining the presence of mutations in the new protein in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoletic disorders, diseases of the immune system, AIDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammation, arking allergies, neurological disorders (e.g., alzhelmer's disease, atherosclerosis, skin disorders (e.g., psoriasis), sepsis, diabetes, atherosclerosis, astrointestinal disorders, prequency disorders, and infections. The proteins can also be used to aid wound canburn, to maintain organs before transplantation, for supporting contact ligands or binding partners, and in chemotaxis, and can be used to a sea food additive or preservative to modify storage properties.

Altibodies specific for a protein of the invention can be used in a sea food additive or preservative to modify storage properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Liver activin; beta c; beta e; cell differentiation; haematopoiesis; erythroid; ovarian follicular maturation; hormone; neuronal survival; spermatopenesis; bone; insulin; cardiac morphogenesis; osteoporosis; osteomalacia; erythropoiesis; haemophilia; cystic fibrosis; immunoassay; menstrual disorder; transgenic; modulator; ss.

/note= "activin beta c exon 1"

```
This represents the sequence of mouse activin genetic loci. The invention relates to murine beta c and beta e polypeptides and the genes encoding them. Disorders of cell growth or differentiation (or susceptibility to them.) are diagnosed by measuring liver activin gene activity or by detecting a mutation in the liver activin gene activity or by casemone secretion, neuronal survival, spermatogenesis of formation, hormone secretion, neuronal survival, spermatogenesis, bone formation, contains secretion or cardiac morphogenesis are some conditions that can be stimulated by treatment with an liver activin. Cell growth and differentiation can upregulates the compound's expression. Antagonists can be used to treat to liver diseases while agonists can be used to increase growth and regeneration of liver tissue. The liver activin compound may also induce bone growth (e.g. for treating osteoporosis or osteomalacia) or heamtopolesis, particularly erythropolesis, e.g. for treating chemophilia, cystic fibrosis or menstrual disorders. Antibodies which bind the mennoassays, to generate anti-idiotypic antibodies (which bind transgenic animals containing liver activin gene can be used to produce the liver activin (in correctly processed and modified forms) proteins, modivisors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid encoding sub-units of liver activin - useful for regulating growth and differentiation of cells, e.g. for treating liver, bone and haematopoietic disorders

susceptibility to them) are diagnosed by measuring liver activin gene activity or by detecting a mutation in the liver activin gene. Disorders of haematopolesis, erythroid differentiation, ovarian follicular maturation, hormone secretion, neuronal survival, spermatogenesis, bone formation, insulin secretion or cardiac morphogenesis are some conditions that can be diagnosed using the liver activin. Cell growth and additions differentiation can be stimulated by treatment with an liver activin compound or agent that upregulates the compound's expression. Antagonists can be used to treat liver diseases while agonists can be used to compound may also induce bone growth (e.g. for treating osteoporosis or osteomatopolesis, particularly erythropolesis, e.g. for treating haemophilia, cystic fibrosis or menstrual disorders. Antibodies are useful in immunoassays, to generate anti-idiotypic antibodies (which the liver activin containing liver activin activin also, the liver activin mans series and modified forms) proteins, madanistrators.

ö
The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to single exon nucleic acid probes (SENP). No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                            * NOTE: This is a 'working draft' sequence. It currently consists of I contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SOURCE INFORMATION:
Clone CTB-14E15 is from the first release of the human BAC library
CLIDB-9788K-B. The library ochtains cloned DNA from the male
fibroblast cell line 9788K. See: Shizuya et al., Proc. Mari.
Acad. Sci. USA 89:8794-7 (1992); U-J. Kim et al., Genomics 34:213-8
(1996). This clone is available from Research Genetics, Inc.
                                                                                                                                                                                                                                                                                                                                          NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence was finished as follows unless otherwise noted:
all regions were double stranded, sequenced with an alternate
chemistry, or covered by high quality data (1.e., phred quality >=
30); an attempt was made to resolve all sequencing problems, such
as compressions and repetts; all regions were covered by sequence
from more than one subclone; and the assembly was confirmed by
restriction digest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Due to low quality, the fidelity of the sequence from 130932 to 130982 can not be guaranteed.

            The specification describes a pair of transgenic winter oilseed rape expression cassette comprising a male-sterility gene (e.g. barnase gene), and the other plant has an expression cassette comprising a fertility restorer gene (e.g. barstar gene), integrated into the genome. The fertility restorer gene is capable of preventing the activity of the male-sterility gene. The plant pair is useful for producing hybrid seed, plants developed from the hybrid seed have agronomic performance. PCR primers AAHS157-98 were used to amplify endogenous sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PCR primer B04, to recognise foreign DNA and flanking sequence of MS-B2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a transgenic Brassica plant or its seed, cells or tissues, characterised by harbouring a specific transformation event, particularly by the presence of a male-sterility gene, at a specific location in the Brassica genome. Transgenic transgenic plant with a male-fertile Brassica genome. Transgenic the transgenic plant with a male-fertile Brassica plant and harvesting the hybrid seed from the transgenic Brassica plant.

The present sequence is PCR primer which is used to recognise foreign DNA and a flanking sequence of elite event MS-B2.

It can be used in the prodn. of transgenic plants expressing cruciferin in its seeds for use in an industrial process. The seeds contg. the cruciferin can be used without the need for first extracting and/or isolating the enzymes. The use of seeds for the storage of cruciferin provides a stable vehicle which is easily packaged and transported and easily handled during use.

The sequences given in AAQ37510-14 are fragments which represent repeat repeat is highly conserved and has characteristics of a transposable element. Over 20 copies of the repeat sequence are found in the chromosome and virulence plasmid of Shigella. The repeat occurs in 1 to 3 copies in some E. coli competitors, but not in other bacterial species. These fragments were used to design probes which are specific to Shigella and Enteroinvasive E. coli (EIEC). The probes are specific to a stable region of the Shigella or E. coli genome, and not the unstable virulence plasmid, which means that they are more reliable than previous probes in the detection of dysentry causing microbes. See also AAQ37506-35.

These fragments were used to design probes which are specific to Shigella and Enteroinvasive E. coll (EIEC). The probes are specific to a stable region of the Shigella or E. coll genome, and not the unstable virulence plasmid, which means that they are more reliable than previous probes in the detection of dysentry causing microbes. See also AAQ37506-35.

                                                                                                                                                                                                                                              ö
                      The sequences given in AAQ37510-14 are fragments which represent repeat sequences derived from the chromosome of E. coli and S. flexneri. The repeat is highly conserved and has characteristics of a transposable element. Over 20 copies of the repeat sequence are found in the chromosome and virulence plasmid of Shigella. The repeat occurs in 1 to 3 copies in some E. coli competitors, but not in other bacterial species. These fragments were used to design probes which are specific to Shigella and Enteroinvasive E. coli (EIEC). The probes are specific to a stable region of the Shigella or E. coli genome, and not the unstable virulence plasmid, which means that they are more microbes. See also AAQ37506-35.

The sequence is that of a gene encoding a suppressor of cytokine signalling protein (SOCS). SOCS can be used to screen for naturally occurring antibodies to SOCS, which may occur, e.g. in some autoimmune diseases. Alternatively, specific antibodies can be used to screen for SOCS, which is useful as a knowledge of SOCS levels may be important for the diagnosis of certain cancers. Soluble SOCS polypeptides can be used to treat disease, injury or abnormality involving cytokine mediated cellular responsiveness, e.g. hyperimmunity, immunosuppression, allergies and hypertension.
